

## *IP Security Products: Can we stack multiple VR-N900U (servers) together?*

Yes, multiple VRN900 can be connected together using a Milestone XProtect Enterprise server.

The physical server running Milestone XProtect Enterprise software is designated as "Master" on the network while all VRN900 are designated as "Slaves" The Master does NOT require any camera license or storage.. Any user who wants to see images coming from different camera (slaves) on the same display has to login to the Master using IE. At the first login the master will push the Smart Client software to the client. Once installed, the client will see all available slaves and master (assuming the user has granted rights to do this). The user can build his own custom view gathering images from different slaves. This custom view can be made private or shared.

If an user logs in, using IE to one of the slaves, he can view images coming ONLY from that slave!
