

*Reference Series: My RS45's lamp exploded/popped identified by an audible noise. The old assembly had some broken glass from the tube inside the assembly. My question is related to mercury gas emission/cleanup. Other than having replaced the lamp, is there any cleanup i need to do? Should i be concerned about mercury gas poisoning?*

Please vacuum out small pieces of glass, being careful not to be cut. Otherwise you should be fine. Here's a link to the materials safety data sheet on the lamp:
